GUIDE TO GOOD CARE

Welcome to NovoTrack - your program to good diabetes care!
This program was designed for you. You will find what you need to know about diabetes in the Guide to Good Care, Personal Scorecard and Message Center.

Guide to Good Care is a course in 7 tracks with 35 topics that were chosen to fit you and your diabetes. We recommend that you start at the beginning, but you can start anywhere and complete the topics in any order. Remember to answer the questions after reading each topic. You can reach the course by selecting a numbered button at the top of this page.

Personal Scorecard gives you access to vital information about your diabetes from your primary care provider. Explanations of each test help you to understand where you are now and where you should be going to reach the goals of good diabetes care. The Personal Scorecard can be reached from this homepage on the right or from the BioBox on the left of each page.

Message Center is a secure way to send messages to a nurse in your physicians office who can find answers to your questions about diabetes. The nurse will be following your progress through the Guide to Good Care. Remember that you and your physician make all the decisions about your individual medical care. Message Center can be reached from this homepage on the right or from the BioBox on the left of each page.

You can reach this homepage at any time by clicking on "NovoTrack" in the upper left corner or the "Home" menu item at the top of each page.

Now you are ready to get your diabetes on track - NovoTrack!

WHAT IS DIABETES?

This section explains how your body works and what happened when you got diabetes.

Before you had diabetes, your body automatically made adjustments to keep your blood glucose at just the right level. Now that you have diabetes, you have to think about it. You have to make decisions that your body once made for you.

This section will tell you how your body worked before you had diabetes and how it works now.

WHAT IS DIABETES?

FIG. 7D(1)

Effects of Diabetes

A Healthy Life

People with diabetes can live long and active lives. Knowing how to treat your diabetes can help you avoid the symptoms of high and low blood glucose. Maintaining good diabetes control over time reduces the risk of long term complications.

No one would want to have diabetes, but those who rise to the challenge of good diabetes care may find strengths that they never knew they had.

High Blood Glucose

Both high and low blood glucose can cause symptoms that go away after the blood glucose returns to an acceptable level. In rare circumstances, extremes of either high or low blood glucose can lead to coma with results that may not be easy to reverse.

The symptoms of a very high blood glucose are thirst, excessive urination, fatigue, weakness and loss of weight. Other symptoms can occur including blurring of vision and difficulty healing wounds or fighting infections.

When your blood glucose is very high, the body can flush some of the excess blood glucose out of your system by putting it into the urine. You get thirsty as your body loses more and more water in the sugary urine. Frequent trips to the toilet can disturb sleep and interrupt activities during the day.

If a high blood glucose is left untreated, you can begin to lose weight. The weight you lose is not a healthy weight loss. Even though the blood glucose is high, the glucose can't get into the cells so the cells don't get the energy they need to do their work. Muscle is being broken down to make even more glucose. This results in weakness and fatigue.

At a certain level of blood glucose, the brain cannot function well. The most severe consequences of an extremely high blood glucose are confusion and eventually coma. These complications can be prevented by the most basic diabetes care.

Low Blood Glucose

Low blood glucose is usually the result of treatment that is not matched to a person's needs. This topic is covered extensively in Section 2 Using Medications Wisely.

Long-Term Complications

The complications of diabetes are not inevitable. High blood glucose can damage many different organs in your body. How diabetes damages an organ is complex and not completely understood even by scientists who study these problems. It has been shown by a number of studies that maintaining good control of blood glucose reduces the risk of complications. Control of other risks such as high blood pressure and cholesterol can also reduce the risk of complications.

People can live long and healthy lives with diabetes.

Thirst, excessive urination and other symptoms of diabetes do not occur until the blood glucose levels are extremely high.

Loss of vision (and other long term complications) can be prevented by good diabetes care.

Weight loss because of

Each of the major complications of diabetes is discussed at greater length in Track 6 Complications.

Heart Disease

You may not think of a heart attack as a complication of diabetes - but it is! People with diabetes are at greater risk of diseases caused by cholesterol that builds up and blocks vital arteries. People without diabetes can get blockage in an artery leading to a heart attack, stroke or other circulatory complication. Diabetes just makes all of these complications worse.

Fortunately, various treatments have been shown to reduce the risk of heart disease and other circulatory problems for people with diabetes. You can learn more about this subject in Track 4 Treating High Blood Pressure and Treating High Cholesterol and in Track 6 Heart Disease.

Go To Questions

high blood glucose is not healthy. A large part of the weight loss is muscle - with weakness and fatigue as a result.

Diabetes increases the risk of heart disease. Good diabetes care reduces the risk.

How Am I Doing?

This is a good question to ask. Your personal scorecard helps you to answer this question.

Each of the test results to the right of this page has been selected with a purpose. Click on the test result to see an explanation of the test and its significance to your health.

Each test predicts the risk of one or more of the long-term complications of diabetes. For each test, treatment that moves the value toward the recommended goal is beneficial.

Not everyone can achieve the goals set by the American Diabetes Association and others. For some, these recommendations are not appropriate due to other medical concerns. You and your healthcare provider will need to decide goals that are appropriate for you. You can record these values by clicking the Personal Diabetes Goals at the bottom of the column to your right.
